

# OpenVAS Vulnerability Scan Report

**Target:** 127.0.0.1 (localhost - Linux system)

**Scanner:** OpenVAS (Greenbone Community Edition)

## Summary of Findings:

- Critical: Outdated OpenSSL version detected
- High: SSH service (port 22) allows weak ciphers
- Medium: Linux kernel missing latest patches

## Mitigation Recommendations:

- Upgrade OpenSSL using apt
- Configure SSH to disable weak algorithms
- Regularly apply system and kernel updates
